WRITE TO LATEX

The files are stored in the working directory. You can change the working directory to the "Tables" folder under "Latex" under "Prosjekt" to update the tables traight into Latex.

```
# Define the folder where you want to save the tables
output folder table <- "/Users/augustarnstad/Library/CloudStorage/OneDrive-NTNU/Semester 9/Prosjekt/Lat
# Create the folder if it doesn't exist
if (!dir.exists(output_folder_table)) {
    dir.create(output_folder_table, recursive = TRUE)
}
# Save tables for Variance_V1
for (cov_level in names(all_summary_tables$Variance_V1)) {
    latex_table <- xtable(all_summary_tables$Variance_V1[[cov_level]],</pre>
        include.rownames = FALSE, digits = 5)
    file_name <- file.path(output_folder_table, paste("Variance_V1_summary_cov_",</pre>
        cov_level, ".tex", sep = ""))
    print(latex_table, file = file_name, include.rownames = FALSE)
# Save tables for Variance_V2
for (cov_level in names(all_summary_tables$Variance_V2)) {
    latex table <- xtable(all summary tables$Variance V2[[cov level]],</pre>
        include.rownames = FALSE, digits = 5)
    file_name <- file.path(output_folder_table, paste("Variance_V2_summary_cov_",</pre>
```

```
cov_level, ".tex", sep = ""))
   print(latex_table, file = file_name, include.rownames = FALSE)
}
# Save tables for Variance_V3
for (cov_level in names(all_summary_tables$Variance_V3)) {
    latex_table <- xtable(all_summary_tables$Variance_V3[[cov_level]],</pre>
        include.rownames = FALSE, digits = 5)
   file_name <- file.path(output_folder_table, paste("Variance_V3_summary_cov_",</pre>
        cov_level, ".tex", sep = ""))
   print(latex_table, file = file_name, include.rownames = FALSE)
}

```

Summary

I am a bit unceratin if I sampled the lmm good enough. I think this needs some investigation, because it seems to take no effect of the higher covariance.

In general it seems that INLA resists the negative effect of higher covariance the same or even better than the decomposition from relaimpo and Matre. Judging by the table for V1 it seems that the mean value of the

INLA importance does not get dragged as much up as the others. Very exciting results. The results are in general very similar, but I notice that INLA often hugs a bit closer to the theoretical value then the others as covariance increases.

How should I format this and include it in my thesis in a suitable and appropriate way?
